

CAM LIFT DOOR BOTTOM SEAL

- Loosen screws (1) on the bottom housing.
- Close the door and adjust the door housing (2) so that the neoprene seal (3) makes firm contact full width of threshold. Snug up screws (1).
- Open door and move housing down evenly an additional 1/16 ±" across width of the door and tighten the screws (1).
- The neoprene seal should be trimmed to extend beyond the door to make contact with the frame.
- Sand or other construction debris will damage the door bottom seal making it very important to keep the area around the doors clean once the doors have been installed.
- Final finished floor MUST be level throughout the entire door swing area to maintain the required door bottom clearance. The threshold surface at the door bottom must be flat and level.
